*Journal of Agricultural and Food Chemistry* 2011, 59, 10261–10270 DOI: 10.1021/jf201670t

There was a typographic error on the y-axis label of graphs D and E of Figure 4 (UI should read mUI). The revised figure appears below.

**Figure 4.** Initial (hatchery) and final (after the homogenization period) muscle growth (RNA:protein ratio, A; RNA:DNA ratio, B; and protein:DNA ratio, C) and metabolic (COX activity, D; CS activity, E; and COX:CS ratio, F) indices of muscle samples of sea bream fingerlings produced in the three farms. Columns assigned a different letter are significantly different between groups ( $P < 0.05$ ), and an asterisk indicates significant differences after (initial) and before (final) the homogenization period ( $P < 0.05$ ).
