

## Correction to Nanoplastic Affects Growth of *S. obliquus* and Reproduction of *D. magna*

Ellen Besseling,\* Bo Wang, Miquel Lüring, and Albert A. Koelmans

*Environ. Sci. Technol.* **2014**, 48, 12336–12343; DOI: 10.1021/es503001d

Two corrections to the Implication Section of our paper<sup>1</sup> are needed. The corrections do not change the conclusions of our paper. In the original paper, a range of 0.04–34 ng/L was mentioned for the microplastic concentrations found in fresh water in the U.S.<sup>2</sup> and Europe.<sup>3</sup> This range should have been 0.4–34 ng/L. Furthermore, a trawling depth of 0.01 m was mentioned, which should have been 0.1 m. Correction of these errors results in the conclusion that our observed effect concentrations are a factor  $10^6$ – $10^8$  higher (previously:  $10^6$ ) than the 0.4–34 ng/L microplastic concentrations found in fresh water in the U.S.<sup>2</sup> and Europe,<sup>3</sup> and about 2 orders of magnitude higher than the highest reported microplastic concentration in marine water.<sup>4</sup> The implications and conclusions based on these comparisons remain the same.
